

# Package: ChrAccR (via r-universe)

August 27, 2024

**Title** Analyzing chromatin accessibility data in R

**Description** Tools for analyzing chromatin accessibility data in R.  
Bulk and single-cell ATAC-seq data are supported.

**Date** 2023-03-08

**Suggests** ChrAccRex, muReportR, DelayedArray, HDF5Array, chromVAR, motifmatchr, chromVARmotifs, GenomicFeatures, Rsamtools, Biostrings, knitr, rmarkdown, jsonlite, cluster, matrixStats, preprocessCore, R.utils, tools, grid, cowplot, uwot, rtracklayer, DESeq2, limma, LOLA, qvalue, TFBSTools, seqLogo, pheatmap, grid, circlize, ComplexHeatmap, grDevices, BSgenome.Hsapiens.NCBI.GRCh38, BSgenome.Hsapiens.UCSC.hg38, BSgenome.Hsapiens.1000genomes.hs37d5, BSgenome.Hsapiens.UCSC.hg19, BSgenome.Mmusculus.UCSC.mm10, BSgenome.Mmusculus.UCSC.mm9, JASPAR2018

**Imports** S4Vectors, IRanges, GenomeInfoDb, GenomicRanges, GenomicAlignments, SummarizedExperiment, ggplot2, muLogR, muRtools, Matrix, methods, stats, utils, data.table

**License** GPL-2

**Version** 0.9.21

**Collate** 'ChrAccR.R' 'classDefs.R' 'utils.R' 'config.R' 'utils\_atac.R' 'utils\_motifs.R' 'annotation.R' 'utils\_chromVAR.R' 'utils\_filehandling.R' 'DsAcc-class.R' 'DsATAC-class.R' 'DsATACsc-class.R' 'DsNOME-class.R' 'import\_atac.R' 'import\_atac\_10x.R' 'import\_atac\_archr.R' 'importTools\_nome.R' 'differential\_nome.R' 'differential.R' 'report\_atac\_summary.R' 'report\_atac\_filtering.R' 'report\_atac\_normalization.R' 'report\_atac\_exploratory.R' 'report\_atac\_differential.R' 'workflow.R'

**VignetteBuilder** knitr

**Encoding** UTF-8

**RoxygenNote** 7.1.1

**Repository** <https://blaserlab.r-universe.dev>

**RemoteUrl** <https://github.com/GreenleafLab/ChrAccR>

**RemoteRef** HEAD

**RemoteSha** 43d010896dc95cedac3a8ea69aae3f67b2ced910

addSampleAnnotCol,DsAcc-method  
*addSampleAnnotCol-methods*

---

**Description**

add a sample annotation column to the sample annotation table

**Usage**

```
## S4 method for signature 'DsAcc'  
addSampleAnnotCol(.object, name, vals)
```

**Arguments**

.object	DsAcc object
name	a name for the new column
vals	vector of values

**Value**

a new DsAcc object with added sample annotation

**Author(s)**

Fabian Mueller

---

aggregateRegionCounts,DsATAC-method  
*aggregateRegionCounts-methods*

---

**Description**

Agregate counts across a set of regions, e.g. for footprinting analysis

**Usage**

```
## S4 method for signature 'DsATAC'  
aggregateRegionCounts(  
  .object,  
  regionGr,  
  samples = getSamples(.object),  
  countAggrFun = "sum",  
  norm = "tailMean",  
  normTailW = 0.1,  
  kmerBiasAdj = TRUE,  
  k = 6,  
  sampleCovg = NULL,  
  sampleKmerFreqM = NULL,  
  regionKmerFreqM = NULL,  
  silent = FALSE  
)
```

**Arguments**

<code>.object</code>	DsATAC object
<code>regionGr</code>	GRanges object specifying the regions to aggregate over
<code>samples</code>	sample identifiers
<code>countAggrFun</code>	aggration function to be used for summarizing the insertion counts at each position. Possible values include "sum", "mean", and "median"
<code>norm</code>	method used for normalizing the resulting position-wise counts. Currently only 'tailMean' is supported, which computes normalization factors as the mean signal in the tails of the window
<code>normTailW</code>	fraction of the region window to be used on each side of the window to be used for normalization if norm is one of 'tailMean'
<code>kmerBiasAdj</code>	compute Tn5 bias and use it to adjust the counts as in Corces, et al., Science, (2018)
<code>k</code>	length of the kmer to be used for sequence bias correction. Only relevant if <code>kmerBiasAdj==TRUE</code> .
<code>sampleCovg</code>	to save compute time, a sample coverage track list (as computed by <code>getCoverage(.object)</code> ) can be supplied. If not, it will be computed on the fly.
<code>sampleKmerFreqM</code>	to save compute time, a matrix of sample kmer frequency at insertion sites (as computed by <code>getInsertionKmerFreq(.object, ...)</code> ) can be supplied. If not, it will be computed on the fly. Only relevant if <code>kmerBiasAdj==TRUE</code> .
<code>regionKmerFreqM</code>	to save compute time, a matrix of region kmer frequencies (kmers X window width). Must have the same number of rows as the specified (or computed) <code>sampleKmerFreqM</code> (kmers) and the same number of columns as the window width (median width of <code>regionGr</code> ). Only relevant if <code>kmerBiasAdj==TRUE</code> .
<code>silent</code>	limit log messages

**Value**

a data.frame containing position-wise counts (raw, normalized and optionally Tn5-bias-corrected) for each sample

**Author(s)**

Fabian Mueller

---

callPeaks,DsATAC-method  
*callPeaks-methods*

---

## Description

Performs peak calling based on insertion sites

## Usage

```
## S4 method for signature 'DsATAC'
callPeaks(
  .object,
  samples = getSamples(.object),
  method = "macs2_summit_fw_no",
  methodOpts = list(macs2.exec = "macs2", macs2.params = c("--shift", "-75",
    "--extsize", "150", "-p", "0.01"), fixedWidth = 250, genomeSizesFromObject = FALSE)
)
```

## Arguments

<code>.object</code>	DsATAC object
<code>samples</code>	sample identifiers for which peak calling is performed
<code>method</code>	peak calling method. Currently only 'macs2_summit_fw_no' is supported. See details section.
<code>methodOpts</code>	list of other options depending on the 'method' parameter (see details section).

## Details

The following methods are currently supported

'macs2\_summit\_fw\_no' Fixed-width, non-overlapping peaks based on MACS2 summit calls: 1. Call peaks using system call to MACS2. You can specify the MACS2 executable in `methodOpts$macs2.exec`. 2. Identify peak summits 3. extend peak summits on each side by a number of basepairs (specified in `methodOpts$fixedWidth`; default: 250bp) to obtain unified peak widths 4. Find non-overlapping peaks by taking the peak with the best MACS2 score from each set of partially overlapping peaks

## Value

GRangesList of peak coordinates for each sample

## Author(s)

Fabian Mueller

---

ChrAccR	<i>ChrAccR: Analyzing chromatin accessibility data in R.</i>
---------	--

---

**Description**

Tools for analyzing chromatin accessibility data in R. Currently supports ATAC-seq and NOME-seq data analysis.

---

cleanMem	<i>cleanMem</i>
----------	-----------------

---

**Description**

clean the system mory by invoking the garbage collector

**Usage**

```
cleanMem(iter.gc = 1L)
```

**Arguments**

`iter.gc`            number of times to invoke the garbage collector

**Value**

nothing of particular interest

**Author(s)**

Fabian Mueller

---

collapseMotifMatrix	<i>collapseMotifMatrix</i>
---------------------	----------------------------

---

**Description**

Collapse TF motif matrix of arbitrary values by aggregating values over motif cluster assignment

**Usage**

```
collapseMotifMatrix(  
  X,  
  motifClust = NULL,  
  assembly = "hg38",  
  motifs = "jaspar",  
  aggrFun = mean  
)
```

**Arguments**

<code>X</code>	matrix to be collapsed. Must have the motif names as rownames. E.g. matrix obtained by <code>chromVAR::deviationScores</code>
<code>motifClust</code>	optional: motif clustering computed by <a href="#">getMotifClustering</a> . If NULL (default) the default clustering will be retrieved
<code>assembly</code>	genome assembly for which the motif clustering should be retrieved. Only required if for automatic mode (i.e. <code>motifClust=NULL</code> ).
<code>motifs</code>	a character string specifying the motif set (currently only "jaspar" is supported)
<code>aggrFun</code>	function to use to aggregate values

**Value**

list containing two elements: `X`: Collapsed matrix containing motif cluster aggregated values; `clustering`: clustering result used for aggregation (see [getMotifClustering](#) for details)

**Author(s)**

Fabian Mueller

---

colZscores

*colZscores*

---

**Description**

Performs z-score normalization on the columns of a matrix. (Basically a wrapper around `matrixStats`)

**Usage**

```
colZscores(X, na.rm = FALSE)
```

**Arguments**

<code>X</code>	input matrix
<code>na.rm</code>	should NAs be omitted?

**Value**

z-score normalized matrix

**Author(s)**

Fabian Mueller

---

```
computeDiffAcc.rnb.nome
```

```
computeDiffAcc.rnb.nome
```

---

## Description

computes differential accessibility for NOME datasets using RnBeads functionality

## Usage

```
computeDiffAcc.rnb.nome(
  dsn,
  cmpCols,
  regionTypes = getRegionTypes(dsn),
  covgThres = 5L,
  allPairs = TRUE,
  adjPairCols = NULL,
  adjCols = NULL,
  skipSites = FALSE,
  disk.dump = rnb.getOption("disk.dump.big.matrices"),
  disk.dump.dir = tempfile(pattern = "diffMethTables_"),
  ...
)
```

## Arguments

<code>dsn</code>	<a href="#">DsNOME</a> object
<code>cmpCols</code>	column names of the sample annotation of the dataset that will be used for comparison
<code>regionTypes</code>	which region types should be processed for differential analysis.
<code>covgThres</code>	coverage threshold for computing the summary statistics. See <code>RnBeads::computeDiffTab.extended.si</code> for details.
<code>allPairs</code>	Logical indicating whether all pairwise comparisons should be conducted, when more than 2 groups are present
<code>adjPairCols</code>	argument passed on to <code>rnb.sample.groups</code> . See its documentation for details.
<code>adjCols</code>	not used yet
<code>skipSites</code>	flag indicating whether differential methylation in regions should be computed directly and not from sites. This leads to skipping of site-specific differential methylation
<code>disk.dump</code>	Flag indicating whether the resulting differential methylation object should be file backed, i.e the matrices dumped to disk
<code>disk.dump.dir</code>	disk location for file backing of the resulting differential methylation object. Only meaningful if <code>disk.dump=TRUE</code> . must be a character specifying a NON-EXISTING valid directory.
<code>...</code>	arguments passed on to binary differential methylation calling. See <code>RnBeads::computeDiffTab.extended</code> for details.

**Value**

an RnBDiffMeth object. See class description for details.

**Author(s)**

Fabian Mueller

Fabian Mueller

---

createReport\_differential,DsATAC-method  
*createReport\_differential-methods*

---

**Description**

Create a report summarizing differential accessibility analysis

**Usage**

```
## S4 method for signature 'DsATAC'
createReport_differential(.object, reportDir)
```

**Arguments**

.object	DsATAC object
reportDir	directory in which the report will be created
chromVarObj	[optional] pre-computed result of a call to run_atac_chromvar(...)

**Value**

(invisible) muReportR: :Report object containing the report

**Author(s)**

Fabian Mueller

**Examples**

```
## Not run:
dsa <- ChrAccRex::loadExample("dsAtac_ia_example")
reportDir <- file.path(".", "ChrAccR_reports")
setConfigElement("regionTypes", setdiff(getRegionTypes(dsa), c("promoters_gc_protein_coding", "t10k")))
setConfigElement("differentialColumns", c("stimulus", "cellType"))
# adjust for the donor annotation in the differential test
setConfigElement("differentialAdjColumns", c("donor"))
# create the report
createReport_differential(dsa, reportDir)

## End(Not run)
```

---

createReport\_exploratory,DsATAC-method  
*createReport\_exploratory-methods*

---

## Description

Create a report summarizing exploratory analyses of an accessibility dataset

## Usage

```
## S4 method for signature 'DsATAC'
createReport_exploratory(
  .object,
  reportDir,
  chromVarObj = NULL,
  itLsiObj = NULL,
  geneActSe = NULL
)
```

## Arguments

<code>.object</code>	DsATAC object
<code>reportDir</code>	directory in which the report will be created
<code>chromVarObj</code>	[optional] pre-computed result of a call to <code>run_atac_chromvar(...)</code>
<code>itLsiObj</code>	[for single-cell only; optional] pre-computed result of a call to <code>iterativeLSI(.object, ...)</code>
<code>geneActSe</code>	[for single-cell only; optional] pre-computed result of a call to <code>getCiceroGeneActivities(.object, ...)</code>

## Value

(invisible) `muReportR::Report` object containing the report

## Author(s)

Fabian Mueller

## Examples

```
## Not run:
dsa <- ChrAccRex::loadExample("dsAtac_ia_example")
dsa_qnorm <- transformCounts(dsa, method="quantile")
setConfigElement("annotationColumns", c("cellType", "donor", "stimulus"))
setConfigElement("regionTypes", setdiff(getRegionTypes(dsa), c("promoters_gc_protein_coding", "t10k")))
reportDir <- file.path(".", "ChrAccR_reports")
createReport_exploratory(dsa_qnorm, reportDir)

## End(Not run)
```

---

createReport\_filtering,DsATAC-method  
*createReport\_filtering-methods*

---

**Description**

Create a report summarizing steps and statistics

**Usage**

```
## S4 method for signature 'DsATAC'  
createReport_filtering(.object, reportDir, unfilteredObj, filterStats = NULL)
```

**Arguments**

.object	filtered <a href="#">DsATAC</a> object
reportDir	directory in which the report will be created
unfilteredObj	unfiltered <a href="#">DsATAC</a> object
filterStats	filtering statistics as output by <a href="#">run_atac_filtering</a>

**Value**

(invisible) muReportR: :Report object containing the report

**Author(s)**

Fabian Mueller

---

createReport\_normalization,DsATAC-method  
*createReport\_normalization-methods*

---

**Description**

Create a report summarizing normalization

**Usage**

```
## S4 method for signature 'DsATAC'  
createReport_normalization(.object, reportDir, unnormObj)
```

**Arguments**

.object	normalized <a href="#">DsATAC</a> object
reportDir	directory in which the report will be created
unnormObj	unnormalized <a href="#">DsATAC</a> object

**Value**

(invisible) muReportR: :Report object containing the report

**Author(s)**

Fabian Mueller

---

createReport\_summary,DsATAC-method  
*createReport\_summary-methods*

---

**Description**

Create a report summarizing an accessibility dataset

**Usage**

```
## S4 method for signature 'DsATAC'  
createReport_summary(.object, reportDir)
```

**Arguments**

.object	DsATAC object
reportDir	directory in which the report will be created

**Value**

(invisible) muReportR: :Report object containing the report

**Author(s)**

Fabian Mueller

**Examples**

```
## Not run:  
dsa <- ChrAccRex::loadExample("dsAtac_ia_example")  
reportDir <- file.path(".", "ChrAccR_reports")  
createReport_summary(dsa, reportDir)  
  
## End(Not run)
```

---

```
dimRed_UMAP,DsATACsc-method
      dimRed_UMAP-methods
```

---

## Description

Retrieve dimension reduction embedding and object using UMAP

## Usage

```
## S4 method for signature 'DsATACsc'
dimRed_UMAP(
  .object,
  regions,
  tfidf = TRUE,
  pcs = 1:50,
  normPcs = FALSE,
  umapParams = list(distMethod = "euclidean", min_dist = 0.5, n_neighbors = 25),
  rmDepthCor = 1
)
```

## Arguments

<code>.object</code>	<a href="#">DsATACsc</a> object
<code>regions</code>	character string specifying the region type to retrieve the UMAP coordinates from. Alternatively, a <code>GRanges</code> object specifying coordinates that fragment counts will be aggregated over
<code>tfidf</code>	normalize the counts using TF-IDF transformation
<code>pcs</code>	components to use to compute the SVD
<code>normPcs</code>	flag indicating whether to apply z-score normalization to PCs for each cell
<code>umapParams</code>	parameters to compute UMAP coordinates (passed on to <code>muRtools::getDimRedCoords.umap</code> and further to <code>uwot::umap</code> )
<code>rmDepthCor</code>	correlation cutoff to be used to discard principal components associated with fragment depth (all iterations). By default (value $\geq 1$ ) no filtering will be applied.

## Details

The output object includes the final singular values/principal components (`result$pcaCoord`), the low-dimensional coordinates (`result$umapCoord`) as well as region set that provided the basis for the dimension reduction (`result$regionGr`).

## Value

an S3 object containing dimensionality reduction results

**Author(s)**

Fabian Mueller

---

DsAcc-class*DsAcc*

---

**Description**

A class for accessibility datasets

**Slots**

coord List of coordinates (GRanges objects) for accessibility summarized regions.

sampleAnnot Sample annotation Table

genome Genome assembly

diskDump Flag indicating whether large matrices and objects will be kept on disk rather than in main memory.

pkgVersion Version number of the ChrAccR package that created the object

**Author(s)**

Fabian Mueller

---

DsATAC-class*DsATAC*

---

**Description**A class for storing ATAC-seq accessibility data inherits from [DsAcc](#)**Slots**

fragments GRanges object storing sequencing fragments. Alternatively pointers to files in which this data is stored as R data object

counts List of count matrices for each summarized region type (dimension: regions X samples). Depending on the settings for the slots diskDump and sparseCounts, the matrices are either (a) regular matrices, (b) HDF5Array/DelayedArray or (c) sparse matrices.

countTransform list of character vectors specifying which transformations have been applied to the count matrices

sparseCounts Flag indicating whether count data will be stored as sparse matrices rather than regular matrices

diskDump.fragments Flag indicating whether fragment data will be kept on disk rather than in main memory.

**Author(s)**

Fabian Mueller

---

DsATAC.bam	<i>DsATAC.bam</i>
------------	-------------------

---

## Description

Create a DsATAC dataset from multiple input bam files

## Usage

```
DsATAC.bam(
  sampleAnnot,
  bamFiles,
  genome,
  regionSets = NULL,
  sampleIdCol = NULL,
  diskDump = FALSE,
  keepInsertionInfo = TRUE,
  pairedEnd = TRUE
)
```

## Arguments

sampleAnnot	data.frame specifying the sample annotation table
bamFiles	either a character vector of the same length as sampleAnnot has rows, specifying the file paths of the bam files for each sample or a single character string specifying the column name in sampleAnnot where the file paths can be found
genome	genome assembly
regionSets	a list of GRanges objects which contain region sets over which count data will be aggregated
sampleIdCol	column name in the sample annotation table containing unique sample identifiers. If NULL (default), the function will look for a column that contains the word "sample"
diskDump	should large data objects (count matrices, fragment data, ...) be disk-backed to save main memory
keepInsertionInfo	flag indicating whether to maintain the insertion information in the resulting object. Only relevant when type=="insBam".
pairedEnd	is the input data paired-end? Only relevant when type=="insBam".

## Value

DsATAC object

## Author(s)

Fabian Mueller

**Examples**

```
## Not run:
# download and unzip the dataset
datasetUrl <- "https://s3.amazonaws.com/muellerf/data/ChrAccR/data/tutorial/tcells.zip"
downFn <- "tcells.zip"
download.file(datasetUrl, downFn)
unzip(downFn, exdir=".")
# prepare the sample annotation table
sampleAnnotFn <- file.path("tcells", "samples.tsv")
bamDir <- file.path("tcells", "bam")
sampleAnnot <- read.table(sampleAnnotFn, sep="\t", header=TRUE, stringsAsFactors=FALSE)
# add a column that ChrAccR can use to find the correct bam file for each sample
sampleAnnot[, "bamFilenameFull"] <- file.path(bamDir, sampleAnnot[, "bamFilename"])
# prepare the dataset
dsa_fromBam <- DsATAC.bam(sampleAnnot, "bamFilenameFull", "hg38", regionSets=NULL, sampleIdCol="sampleId")

## End(Not run)
```

---

DsATAC.cellranger      *DsATAC.cellranger*

---

**Description**

Create a DsATAC dataset from multiple input files output by 10x cellranger

**Usage**

```
DsATAC.cellranger(
  sampleAnnot,
  sampleDirPrefixCol,
  genome,
  dataDir = "",
  regionSets = NULL,
  addPeakRegions = TRUE,
  sampleIdCol = sampleDirPrefixCol,
  keepInsertionInfo = FALSE,
  diskDump.fragments = keepInsertionInfo
)
```

**Arguments**

sampleAnnot	data.frame specifying the sample annotation table
sampleDirPrefixCol	column name specifying the directory prefix for each sample in the sample annotation table
genome	genome assembly
dataDir	directory where the files are located

regionSets	a list of GRanges objects which contain region sets over which count data will be aggregated
addPeakRegions	should a merged set of peaks be created as one of the region sets (merged, non-overlapping peaks of width=500bp from the peaks of individual samples)
sampleIdCol	column name or index in the sample annotation table containing unique sample identifiers
keepInsertionInfo	flag indicating whether to maintain the insertion information in the resulting object.
diskDump.fragments	Keep fragment coordinates stored on disk rather than in main memory. This saves memory, but increases runtime and I/O.

**Value**

DsATAC object

**Author(s)**

Fabian Mueller

---

DsATAC.fragmentBed     *DsATAC.fragmentBed*

---

**Description**

Create a DsATAC dataset from multiple input fragment bed files

**Usage**

```
DsATAC.fragmentBed(
  sampleAnnot,
  bedFiles,
  genome,
  regionSets = NULL,
  sampleIdCol = NULL,
  diskDump = FALSE,
  keepInsertionInfo = TRUE
)
```

**Arguments**

sampleAnnot	data.frame specifying the sample annotation table
bedFiles	either a character vector of the same length as sampleAnnot has rows, specifying the file paths of the bed files for each sample or a single character string specifying the column name in sampleAnnot where the file paths can be found

genome	genome assembly
regionSets	a list of GRanges objects which contain region sets over which count data will be aggregated
sampleIdCol	column name in the sample annotation table containing unique sample identifiers. If NULL (default), the function will look for a column that contains the word "sample"
diskDump	should large data objects (count matrices, fragment data, ...) be disk-backed to save main memory
keepInsertionInfo	flag indicating whether to maintain the insertion information in the resulting object. Only relevant when type=="insBam".

**Value**

DsATAC object

**Author(s)**

Fabian Mueller

---

DsATAC.snakeATAC

*DsATAC.snakeATAC*

---

**Description**

Create a DsATAC dataset from multiple input files output by snakeATAC

**Usage**

```
DsATAC.snakeATAC(
  sampleAnnot,
  filePrefixCol,
  genome,
  dataDir = "",
  regionSets = NULL,
  sampleIdCol = filePrefixCol,
  type = "insBam",
  diskDump = FALSE,
  keepInsertionInfo = TRUE,
  bySample = FALSE,
  pairedEnd = TRUE
)
```

**Arguments**

sampleAnnot	data.frame specifying the sample annotation table
filePrefixCol	column name specifying the file prefix for each sample in the sample annotation table. If dataDir is not empty (i.e. not "") filenames are assumed to be relative to that directory and a corresponding filename suffix will be appended
genome	genome assembly
dataDir	directory where the files are located. If it is the empty character (""); default) it is assumed that filePrefixCol specifies the full path to the input files
regionSets	a list of GRanges objects which contain region sets over which count data will be aggregated
sampleIdCol	column name or index in the sample annotation table containing unique sample identifiers
type	input data type. Currently only "insBed" (insertion beds), "insBam" (insertion info inferred from bam files (aligned reads); default) and "bam" (aligned reads) are supported
diskDump	should large data objects (count matrices, fragment data, ...) be disk-backed to save main memory
keepInsertionInfo	flag indicating whether to maintain the insertion information in the resulting object. Only relevant when type=="insBam".
bySample	process sample-by-sample to save memory (currently only has an effect for type=="insBam")
pairedEnd	is the input data paired-end? Only relevant when type=="insBam".

**Value**

DsATAC object

**Author(s)**

Fabian Mueller

---

DsATACsc-class

*DsATACsc*

---

**Description**

A class for storing single-cell ATAC-seq accessibility data inherits from [DsATAC](#). Provides a few additional methods but is otherwise identical to [DsATAC](#).

**Author(s)**

Fabian Mueller

DsATACsc.archr      *DsATACsc.archr*

---

**Description**

Create a DsATACsc dataset from an ArchR project

**Usage**

```
DsATACsc.archr(  
  ap,  
  useTiling = TRUE,  
  keepInsertionInfo = FALSE,  
  diskDump.fragments = keepInsertionInfo  
)
```

**Arguments**

ap                    ArchR project object

useTiling            flag indicating whether to use tiling information from the ArchR project

keepInsertionInfo    flag indicating whether to maintain the insertion information in the resulting object.

diskDump.fragments    Keep fragment coordinates stored on disk rather than in main memory. This saves memory, but increases runtime and I/O.

**Value**

DsATACsc object

**Author(s)**

Fabian Mueller

---

DsATACsc.fragments      *DsATACsc.fragments*

---

**Description**

Create a DsATACsc dataset from multiple input fragment files

**Usage**

```

DsATACsc.fragments(
  sampleAnnot,
  fragmentFiles,
  genome,
  regionSets = NULL,
  sampleIdCol = NULL,
  minFragPerBarcode = 500L,
  maxFragPerBarcode = Inf,
  cellAnnot = NULL,
  keepInsertionInfo = FALSE,
  diskDump.fragments = keepInsertionInfo,
  cellQcStats = TRUE
)

```

**Arguments**

sampleAnnot	data.frame specifying the sample annotation table
fragmentFiles	vector of fragment files or the column name in the sample annotation table containing these file names. fragment files must be tab-separated with columns "chrom", "chromStart", "chromEnd", "barcode" and "duplicateCount" and must not contain a header line
genome	genome assembly
regionSets	a list of GRanges objects which contain region sets over which count data will be aggregated
sampleIdCol	column name or index in the sample annotation table containing unique sample identifiers
minFragPerBarcode	minimum number of fragments required for a barcode to be kept. [Only relevant if cellAnnot==NULL]
maxFragPerBarcode	maximum number of fragments per barcode. Only barcodes with fewer fragments will be kept. [Only relevant if cellAnnot==NULL]
cellAnnot	(optional) annotation table of all cells in the dataset. Must contain a 'cellId' and 'cellBarcode' columns.
keepInsertionInfo	flag indicating whether to maintain the insertion information in the resulting object.
diskDump.fragments	Keep fragment coordinates stored on disk rather than in main memory. This saves memory, but increases runtime and I/O.
cellQcStats	flag indicating whether to compute additional cell QC statistics (TSS enrichment, etc.).

**Value**

DsATACsc object

**Author(s)**

Fabian Mueller

---

`DsNOMe-class`*DsNOMe*

---

**Description**

A class for storing NOME accessibility data

**Slots**`meth` List of GC methylation for sites and summarized regions.`covg` List of GC read coverage for sites and summarized regions.**Author(s)**

Fabian Mueller

---

`DsNOMe.bisSNP`*DsNOMe.bisSNP*

---

**Description**

Create a DsNOMe dataset from multiple input files in bisSNP output format

**Usage**`DsNOMe.bisSNP(inputFns, sampleAnnot, genome, sampleIds = rownames(sampleAnnot))`**Arguments**

<code>inputFns</code>	a NAMED vector of input file names
<code>sampleAnnot</code>	data.frame specifying the sample annotation table
<code>genome</code>	genome assembly
<code>sampleIds</code>	character vector of sample names

**Value**`DsNOMe` object**Author(s)**

Fabian Mueller

---

exportCountTracks,DsATAC-method  
*exportCountTracks-methods*

---

**Description**

export count data as genome tracks (e.g. for visualization in the browser)

**Usage**

```
## S4 method for signature 'DsATAC'
exportCountTracks(
  .object,
  type,
  outDir,
  formats = c("bed", "igv"),
  groupBy = NULL
)
```

**Arguments**

.object	DsATAC object
type	character string specifying the region type
outDir	output directory. Must be existing.
formats	browser format. Currently only bed and "igv" are supported
groupBy	a column in the sample annotation table to group by (the mean will be computed)

**Value**

nothing of particular interest

**Author(s)**

Fabian Mueller

---

fastqDirToTable      *fastqDirToTable*

---

**Description**

scan a directory containing fastq files and create a sample annotation table from the file names

**Usage**

```
fastqDirToTable(fqDir, tabFn = NULL, pat = "")
```

**Arguments**

fqDir	string specifying a directory with fastq files
tabFn	filename specifying the where the table should be written to. If NULL (default), the table will just be returned as data frame
pat	(optional) regular expression that fastq file names have to pass

**Value**

data frame of parsed annotation

**Author(s)**

Fabian Mueller

---

*filterByGRanges,DsATAC-method*  
*filterByGRanges-methods*

---

**Description**

Filter out regions based on a GRanges object

**Usage**

```
## S4 method for signature 'DsATAC'
filterByGRanges(.object, gr, method = "black")
```

**Arguments**

.object	<a href="#">DsATAC</a> object
gr	GRanges object used for filtering
method	character string specifying the method. Can be "white" to treat gr as a whitelist (i.e. only regions and fragments overlapping with it are retained) or "black" (default) to treat it as a blacklist.

**Value**

a new, filtered [DsATAC](#) object

**Author(s)**

Fabian Mueller

---

filterCellsTssEnrichment,DsATACsc-method  
*filterCellsTssEnrichment-methods*

---

**Description**

Filter out cells with low TSS enrichment

**Usage**

```
## S4 method for signature 'DsATACsc'  
filterCellsTssEnrichment(.object, cutoff = 6)
```

**Arguments**

.object            [DsATAC](#) object  
cutoff            TSS enrichment cutoff to filter cells

**Value**

modified [DsATAC](#) object without filtered cells

**Author(s)**

Fabian Mueller

---

filterChroms,DsATAC-method  
*filterChroms-methods*

---

**Description**

Filter out regions based on chromosome list

**Usage**

```
## S4 method for signature 'DsATAC'  
filterChroms(.object, exclChrom = c("chrX", "chrY", "chrM"))
```

**Arguments**

.object            [DsATAC](#) object  
exclChrom        vector of chromosome names to filter out

**Value**

a new [DsATAC](#) object filtered for chromosomes

**Author(s)**

Fabian Mueller

---

`filterLowCovg,DsATAC-method`  
*filterLowCovg-methods*

---

**Description**

Filter regions with low read counts

**Usage**

```
## S4 method for signature 'DsATAC'  
filterLowCovg(  
  .object,  
  thresh = 1L,  
  reqSamples = 0.75,  
  regionTypes = getRegionTypes(.object)  
)
```

**Arguments**

<code>.object</code>	<a href="#">DsATAC</a> object
<code>thresh</code>	regions with read counts below this threshold will be considered lowly covered regions (default: regions with fewer than 1 read will be discarded)
<code>reqSamples</code>	the percentile of samples required to meet or exceed the threshold in order for a region to be retained. must be in the interval [0, 1) (default: 0.75 = 75 percent)
<code>regionTypes</code>	character vector specifying the names of the region types to which filtering should be applied (default: all region types)

**Value**

a new [DsATAC](#) object with low coverage regions removed

**Author(s)**

Fabian Mueller

---

findNearestGeneForGr *findNearestGeneForGr*

---

### Description

get gene annotation for a GRanges object by linking to the nearest gene

### Usage

```
findNearestGeneForGr(gr, geneGr = NULL, maxDist = 1e+05)
```

### Arguments

gr	GRanges object
geneGr	gene annotation from which to pull the annotation. Can be NULL for automatic retrieval of annotation. Must be named or have a gene name column in the metadata
maxDist	maximum distance for matching to nearest gene

### Value

data.frame containing information on the nearest gene for each element in gr

---

findOrderedNames *findOrderedNames*

---

### Description

find the first occurrence of a name in a vector of strings

### Usage

```
findOrderedNames(x, orderedNames, exact = TRUE, ignore.case = FALSE)
```

### Arguments

x	character vector in which the name should be found
orderedNames	vector of names that will be queried. This method will go through them one by one and find the first occurrence in the order of the orderedNames provided
exact	should only be exact matches be reported
ignore.case	should casing be ignored

**Value**

the string that matches the first occurrence in the order of `orderedNames`. Returns NA if no match is found.

**Author(s)**

Fabian Mueller

---

<code>getATACfragments</code>	<i>getATACfragments</i>
-------------------------------	-------------------------

---

**Description**

Given a `GAlignmentPairs` or `GAlignments` object, return a `GRanges` object containing the fragment (or insertion site for single-end data)

**Usage**

```
getATACfragments(ga, offsetTn = TRUE)
```

**Arguments**

<code>ga</code>	<code>GAlignmentPairs</code> (or <code>GAlignments</code> for single-end sequencing) object
<code>offsetTn</code>	apply offsets for Tn5 dimer cut site (+4 bp on genomic + strand; -4 bp on genomic - strand)

**Value**

`GRanges` object containing derived insertions. For paired-end data (recommended), the width of the resulting ranges corresponds to the insert size for single-end data, the width is set to 1bp

**Author(s)**

Fabian Mueller

---

```
getChrAccRAnnotationPackage
    getChrAccRAnnotationPackage
```

---

**Description**

retrieve the corresponding ChrAccRAnnotation package for a given genome

**Usage**

```
getChrAccRAnnotationPackage(genome)
```

**Arguments**

genome                    character string specifying the genome

**Value**

name of the annotation package, if installed. NULL and a warning if the package is not installed

**Author(s)**

Fabian Mueller

---

```
getChromVarDev, DsATAC-method
    getChromVarDev-methods
```

---

**Description**

Compute chromVar deviations

**Usage**

```
## S4 method for signature 'DsATAC'
getChromVarDev(.object, type, motifs = "jaspar")
```

**Arguments**

.object                    [DsATAC](#) object

type                        character string specifying the region type

motifs                     either a character string (currently only "jaspar" and sets contained in chromVARmotifs ("homer", "encode", "cisbp") are supported) or an object containing PWMs that can be used by motifmatchr::matchMotifs (such as an PFMATRIXLIST or PWMATRIXLIST object)

**Value**

Deviations object as returned by `chromVAR::computeDeviations`

**Author(s)**

Fabian Mueller

---

`getCiceroGeneActivities,DsATAC-method`  
*getCiceroGeneActivities-methods*

---

**Description**

Obtain Cicero gene activities

**Usage**

```
## S4 method for signature 'DsATAC'
getCiceroGeneActivities(
  .object,
  regionType,
  promoterGr = NULL,
  maxDist = 250000L,
  corCutOff = 0.35,
  dimRedCoord = NULL,
  knn.k = 50
)
```

**Arguments**

<code>.object</code>	<a href="#">DsATAC</a> object
<code>regionType</code>	region type of regions that will be linked to the promoter (typical some sort of peak annotation)
<code>promoterGr</code>	GRanges object of promoter coordinates
<code>maxDist</code>	maximum distance to consider for region-region interactions
<code>corCutOff</code>	cutoff of correlation coefficients (Pearson) to consider for region-region interactions
<code>dimRedCoord</code>	matrix of reduced dimension coordinates. must have coordinates for all samples/cells in the dataset
<code>knn.k</code>	parameter k for Cicero's k-nearest-neighbor method

**Value**

an `SummarizedExperiment` object containing gene activities for all cells/samples in the dataset

**Author(s)**

Fabian Mueller

---

getComparisonInfo      *getComparisonInfo*

---

**Description**

retrieve the comparison information for an DsAcc object. Analogous to `RnBeads::get.comparison.info`

**Usage**

```
getComparisonInfo(
  dsa,
  cmpNames = NULL,
  regionTypes = getRegionTypes(dsa),
  allPairs = TRUE,
  adjPairCols = NULL,
  minGrpSize = 1L,
  maxGrpCount = NULL
)
```

**Arguments**

<code>dsa</code>	DsAcc object
<code>cmpNames</code>	column names of the sample annotation of the dataset that will be used for comparison
<code>regionTypes</code>	which region types should be processed for differential analysis.
<code>allPairs</code>	Logical indicating whether all pairwise comparisons should be conducted, when more than 2 groups are present
<code>adjPairCols</code>	argument passed on to <code>rnb.sample.groups</code> . See its documentation for details.
<code>minGrpSize</code>	Minimum number of samples required to form a group in comparison
<code>maxGrpCount</code>	maximum number of groups to consider for comparisons

**Value**

a list containing one element for each comparison to be conducted. Each element is again a list containing:

```
comparison the name of the comparison
pheno.colname the column name of the sample annotation table the comparison is derived from
group.names the names of the two groups being compared
group.inds the sample indices of the samples belonging to the two groups
paired flag indicating whether paired analysis is conducted
```

`adj.sva` flag indicating whether adjustment for SVA is conducted  
`adj.celltype` flag indicating whether adjustment for cell type is conducted  
`adjustment.table` the covariate adjustment table. NULL if the comparison is not adjusted  
`region.types` the region types applicable to the analysis

**Author(s)**

Fabian Mueller

---

`getComparisonTable, DsAcc-method`  
*getComparisonTable-methods*

---

**Description**

Retrieve a table describing pairwise comparisons on a `DsAcc` object

**Usage**

```
## S4 method for signature 'DsAcc'
getComparisonTable(
  .object,
  cols = NULL,
  cols1vAll = NULL,
  compNames = NULL,
  minGroupSize = 2L,
  maxGroupCount = length(.object) - 1
)
```

**Arguments**

<code>.object</code>	<code>DsAcc</code> object
<code>cols</code>	column names in the sample annotation table to consider for pairwise comparisons
<code>cols1vAll</code>	column names in the sample annotation table to consider for 1-vs-all comparisons
<code>compNames</code>	vector of character strings specifying a fixed comparison names to be parsed (format "\$GRP1_NAME vs \$GRP1_NAME [\$ANNOTATION_COLUMN]")
<code>minGroupSize</code>	Minimum size of a group to be used in comparison. Affects the annotation columns that will be used for comparisons.
<code>maxGroupCount</code>	Maximum number of groups for a column to be considered for comparison.

**Value**

a `data.frame` with comparison information containing columns for the comparison name (`compName`), column in the annotation table (`compCol`) and group names for the two groups in the comparison (`grp1Name`, `grp2Name`),

**Author(s)**

Fabian Mueller

---

`getConfigElement`      *getConfigElement*

---

**Description**

Get the value for a configuration item

**Usage**

```
getConfigElement(name)
```

**Arguments**

name                      name of the config item

**Value**

the value of the config item

**Author(s)**

Fabian Mueller

---

`getConsensusPeakSet`      *getConsensusPeakSet*

---

**Description**

Retrieve a consensus peak set from a set of peak lists

**Usage**

```
getConsensusPeakSet(  
    grl,  
    mode = "no_by_score",  
    grouping = NULL,  
    groupAgreePerc = 1,  
    groupConsSelect = FALSE,  
    scoreCol = "score",  
    keepOvInfo = FALSE  
)
```

**Arguments**

<code>gr1</code>	list or <code>GRangesList</code> object containing the peak sets for each sample
<code>mode</code>	consensus mode. Currently only "no_by_score" (non-overlapping; i.e. select the peak with the highest score from each set of overlapping peaks) is supported.
<code>grouping</code>	vector of group memberships (numeric, character or factor). must be of the same length as <code>gr1</code>
<code>groupAgreePerc</code>	percentile of members in a group required to contain a peak in order to keep it. E.g. a value of 1 (default) means that all replicates in a group are required to contain that peak in order to keep it.
<code>groupConsSelect</code>	if set, the peak set will also be checked for consistency, i.e. in order to retain a peak it has to be consistently be present or absent in each group (as specified in <code>groupAgreePerc</code> percent of samples)
<code>scoreCol</code>	name of the column to be used as score in the <code>elementMetadata</code> of the peak sets. This will determine which peak is selected if multiple peaks overlap
<code>keepOvInfo</code>	keep annotation columns in the <code>elementMetadata</code> of the results specifying whether a consensus peak overlaps with a peak in each sample

**Value**

`GRanges` object the containing consensus peak set

**Author(s)**

Fabian Mueller

---

`getCoord,DsAcc-method` *getCoord-methods*

---

**Description**

Return coordinates of sites/regions in a dataset

**Usage**

```
## S4 method for signature 'DsAcc'
getCoord(.object, type)
```

**Arguments**

<code>.object</code>	<code>DsAcc</code> object
<code>type</code>	character string specifying the region type or "sites" (default)

**Value**

`GRanges` object containing coordinates for covered sites/regions

**Author(s)**

Fabian Mueller

---

getCounts,DsATAC-method  
*getCounts-methods*

---

**Description**

Return table of count values

**Usage**

```
## S4 method for signature 'DsATAC'  
getCounts(  
  .object,  
  type,  
  i = NULL,  
  j = NULL,  
  asMatrix = TRUE,  
  naIsZero = TRUE,  
  allowSparseMatrix = FALSE  
)
```

**Arguments**

<code>.object</code>	DsATAC object
<code>type</code>	character string specifying the region type
<code>i</code>	(optional) row (region) indices
<code>j</code>	(optional) column (sample) indices
<code>asMatrix</code>	return a matrix object instead of the internal representation
<code>naIsZero</code>	should NAs in the count matrix be considered 0 value (instead of unknown/missing)
<code>allowSparseMatrix</code>	if <code>asMatrix</code> : allow for sparse matrices as returned data format

**Value**

Matrix containing counts for each region and sample

**Author(s)**

Fabian Mueller

---

getCountsSE,DsATAC-method

*getCountsSE-methods*

---

### Description

Return a SummarizedExperiment object of count values

### Usage

```
## S4 method for signature 'DsATAC'  
getCountsSE(.object, type, naIsZero = TRUE)
```

### Arguments

.object	DsATAC object
type	character string specifying the region type
naIsZero	should NAs in the count matrix be considered 0 value (instead of unknown/missing)

### Value

SummarizedExperiment containing counts for each region and sample

### Author(s)

Fabian Mueller

### Examples

```
## Not run:  
dsa <- ChrAccRex::loadExample("dsAtac_ia_example")  
se <- getCountsSE(dsa, "IA_prog_peaks")  
se  
  
## End(Not run)
```

---

getCoverage,DsATAC-method

*getCoverage-methods*

---

### Description

Return a list of genome-wide coverage from insertion sites

**Usage**

```
## S4 method for signature 'DsATAC'  
getCoverage(.object, samples = getSamples(.object))
```

**Arguments**

.object            [DsATAC](#) object  
samples            sample identifiers

**Value**

list of Rle objects of sample coverage tracks

**Author(s)**

Fabian Mueller

---

*getCovg,DsNOMe-method*    *getCovg-methods*

---

**Description**

Return table of read coverage values

**Usage**

```
## S4 method for signature 'DsNOMe'  
getCovg(.object, type = "sites", asMatrix = FALSE)
```

**Arguments**

.object            [DsNOMe](#) object  
type                character string specifying the region type or "sites" (default)  
asMatrix            return a matrix instead of a data.table

**Value**

data.table or matrix containing read coverage for each site/region and sample

**Author(s)**

Fabian Mueller

---

getDESeq2Dataset,DsATAC-method  
*getDESeq2Dataset-methods*

---

## Description

Retrieve a differential expression dataset computed with DESeq2

## Usage

```
## S4 method for signature 'DsATAC'  
getDESeq2Dataset(.object, regionType, designCols = NULL, compTab = NULL, ...)
```

## Arguments

<code>.object</code>	DsATAC object
<code>regionType</code>	character string specifying the region type
<code>designCols</code>	column names in the sample annotation potentially used to create the design matrix
<code>compTab</code>	if design columns are not specified, you can specify a comparison table directly. These comparison tables can be obtained by <code>getComparisonTable(...)</code>
<code>...</code>	parameters passed on to <code>DESeq2::DESeq</code>

## Value

DESeqDataSet as returned by `DESeq2::DESeq`

## Author(s)

Fabian Mueller

## Examples

```
## Not run:  
dsa <- ChrAccRex::loadExample("dsAtac_ia_example")  
dds <- getDESeq2Dataset(dsa, "IA_prog_peaks", designCols=c("donor", "stimulus", "cellType"))  
dds  
  
## End(Not run)
```

---

getDiffAcc,DsATAC-method  
*getDiffAcc-methods*

---

**Description**

Compute differential accessibility

**Usage**

```
## S4 method for signature 'DsATAC'  
getDiffAcc(  
  .object,  
  regionType,  
  comparisonCol,  
  grp1Name = NULL,  
  grp2Name = NULL,  
  adjustCols = character(0),  
  method = "DESeq2",  
  diffObj = NULL  
)
```

**Arguments**

.object	DsATAC object
regionType	character string specifying the region type
comparisonCol	column name in the sample annotation table to base the comparison on
grp1Name	name of the first group in the comparison. if not specified, it will be taken as the first factor level specified in the sample annotation table in 'comparisonCol'.
grp2Name	name of the second group (reference) in the comparison. if not specified, it will be taken as the first factor level specified in the sample annotation table in 'comparisonCol'.
adjustCols	column names in the sample annotation potentially used to create the design matrix
method	Method for determining differential accessibility. Currently only 'DESeq2' is supported
diffObj	optional differential object to avoid computing it for each comparison and thus reduce runtime

**Value**

a data.frame containing differential accessibility information

**Author(s)**

Fabian Mueller

**Examples**

```
## Not run:
dsa <- ChrAccRex::loadExample("dsAtac_ia_example")
daTab <- getDiffAcc(dsa, "IA_prog_peaks", "stimulus", grp1Name="S", grp2Name="U", adjustCols=c("cellType", "donor"))

## End(Not run)
```

---

getFragmentGr,DsATAC-method  
*getFragmentGr-methods*

---

**Description**

Return a GRanges object of fragment data for a given sample

**Usage**

```
## S4 method for signature 'DsATAC'
getFragmentGr(.object, sampleId)
```

**Arguments**

.object	DsATAC object
sampleId	sample identifier

**Value**

GRanges object containing fragment data

**Author(s)**

Fabian Mueller

---

getFragmentGr1,DsATAC-method  
*getFragmentGr1-methods*

---

**Description**

Return a list of GRanges objects of fragment data for a given set of samples

**Usage**

```
## S4 method for signature 'DsATAC'
getFragmentGr1(.object, sampleIds, asGRangesList = FALSE)
```

**Arguments**

.object            [DsATAC](#) object  
sampleIds        sample identifiers  
asGRangesList    should a GRangesList object be returned instead of a regular list

**Value**

A named list of GRanges objects containing fragment data

**Author(s)**

Fabian Mueller

---

getFragmentNum,DsATAC-method  
*getFragmentNum-methods*

---

**Description**

Return the number of fragments in the [DsATAC](#) object

**Usage**

```
## S4 method for signature 'DsATAC'  
getFragmentNum(.object, sampleIds = getSamples(.object))
```

**Arguments**

.object            [DsATAC](#) object  
sampleIds        sample identifiers

**Value**

a vector of fragment counts per sample

**Author(s)**

Fabian Mueller

getGenome, DsAcc-method

*getGenome-methods*

---

### Description

Return the genome assembly

### Usage

```
## S4 method for signature 'DsAcc'  
getGenome(.object)
```

### Arguments

.object            [DsAcc](#) object

### Value

Character string containing the genome assembly

### Author(s)

Fabian Mueller

---

getGenomeObject

*getGenomeObject*

---

### Description

retrieve the appropriate BSgenome for an assembly string

### Usage

```
getGenomeObject(assembly, adjChrNames = TRUE)
```

### Arguments

assembly            string specifying the assembly  
adjChrNames        should the prefix "chr" be added to main chromosomes if not already present  
                    and chrMT be renamed to chrM?

### Value

BSgenome object

---

```
getGroupsFromTable    getGroupsFromTable
```

---

**Description**

Retrieve groupings given a table containing some categorical columns

**Usage**

```
getGroupsFromTable(tt, cols = NULL, minGrpSize = 2, maxGrpCount = nrow(tt) - 1)
```

**Arguments**

tt	table to retrieve groupings for
cols	(Optional) predefined column names (in the form of a character vector) or indices (an integer vector) to consider. All other columns in the annotation table will be ignored.
minGrpSize	Minimum number of items required to form a group in comparison
maxGrpCount	Maximum number of groups to be considered

**Value**

List of groupings. Each element corresponds to a categorical column in the table and contains the row indices for each category

**Author(s)**

Fabian Mueller

---

```
getInsertionKmerFreq, DsATAC-method  
getInsertionKmerFreq-methods
```

---

**Description**

compute kmer frequencies at insertion sites for each sample

**Usage**

```
## S4 method for signature 'DsATAC'  
getInsertionKmerFreq(  
  .object,  
  samples = getSamples(.object),  
  k = 6,  
  normGenome = FALSE  
)
```

**Arguments**

<code>.object</code>	DsATAC object
<code>samples</code>	sample identifiers
<code>k</code>	length of the kmer
<code>normGenome</code>	should the result be normalized by genome-wide kmer frequencies

**Value**

a matrix containing kmer frequencies (one row for each kmer and one column for each sample in the dataset)

**Author(s)**

Fabian Mueller

---

`getInsertionSites,DsATAC-method`  
*getInsertionSites-methods*

---

**Description**

Return a list of insertion sites (Tn5 cut sites) for each sample

**Usage**

```
## S4 method for signature 'DsATAC'  
getInsertionSites(  
  .object,  
  samples = getSamples(.object),  
  asGRangesList = FALSE  
)
```

**Arguments**

<code>.object</code>	DsATAC object
<code>samples</code>	sample identifiers
<code>asGRangesList</code>	should a GRangesList object be returned instead of a regular list

**Value**

list or GRangesList containing Tn5 cut sites for each sample

**Author(s)**

Fabian Mueller

---

getJasparAnnot	<i>getJasparAnnot</i>
----------------	-----------------------

---

**Description**

retrieve motif annotation data

**Usage**

```
getJasparAnnot(ss, type = "humantfs")
```

**Arguments**

ss	character vector or JASPAR identifiers
type	annotation type. Currently only "humantfs" (pulls info from humantfs.ccb.utoronto.ca) is supported

**Value**

list of data frames of TF annotation (a motif can have multiple annotated TFs)

**Author(s)**

Fabian Mueller

---

getJasparSymbols	<i>getJasparSymbols</i>
------------------	-------------------------

---

**Description**

Retrieve the TF names (symbols) from a JASPAR identifier

**Usage**

```
getJasparSymbols(ss)
```

**Arguments**

ss	character vector or JASPAR identifiers
----	--

**Value**

a list of TF names (symbols) for each identifier

---

getMeth,DsNOMe-method *getMeth-methods*

---

### Description

Return table of methylation values

### Usage

```
## S4 method for signature 'DsNOMe'
getMeth(.object, type = "sites", asMatrix = FALSE)
```

### Arguments

.object	DsNOMe object
type	character string specifying the region type or "sites" (default)
asMatrix	return a matrix instead of a data.table

### Value

data.table or matrix containing methylation levels for each site/region and sample

### Author(s)

Fabian Mueller

---

getMonocleCellDataSet,DsATAC-method  
*getMonocleCellDataSet-methods*

---

### Description

Obtain cell\_data\_set object for analysis using the monocle3 package

### Usage

```
## S4 method for signature 'DsATAC'
getMonocleCellDataSet(.object, regionType, binarize = TRUE)
```

### Arguments

.object	DsATAC object
regionType	name of the region type to be exported
binarize	should the counts be binarized

**Value**

a `cell_data_set` object containing the counts for the specified region type

**Author(s)**

Fabian Mueller

---

getMotifClustering      *getMotifClustering*

---

**Description**

Retrieve motif clustering of TF motifs

**Usage**

```
getMotifClustering(
  k = 0,
  distM = NULL,
  assembly = "hg38",
  motifs = "jaspar",
  clusterMethod = "pam"
)
```

**Arguments**

<code>k</code>	number of clusters. <code>k &lt; 1</code> will result in an automatically selected clustering which is precomputed and stored in <code>ChrAccR</code> . For <code>distMethod == "jaspar"</code> and <code>clusterMethod == "pam"</code> this corresponds to the <code>k</code> corresponding to the best silhouette value before a drop (in the silhouette elbow-curve) occurs
<code>distM</code>	distance matrix ( <code>dist</code> object) containing motif dissimilarities/distances. Only required if <code>k &gt; 0</code> .
<code>assembly</code>	genome assembly for which the motifs dissimilarity should be retrieved. Only the species information of the assembly is really relevant. Can be <code>"vert"</code> for all vertebrate motifs. Only required if for automatic mode (i.e. <code>k &lt; 1</code> ).
<code>motifs</code>	a character string specifying the motif set (currently only <code>"jaspar"</code> is supported)
<code>clusterMethod</code>	method to be used for motif clustering (currently only <code>'pam'</code> (PAM - partitioning around medoids) is supported)

**Value**

a list structure containing the clustering result

**Author(s)**

Fabian Mueller

---

getMotifDistMat	<i>getMotifDistMat</i>
-----------------	------------------------

---

**Description**

Retrieve motif dissimilarity/distance matrix for TF motifs

**Usage**

```
getMotifDistMat(assembly = "hg38", mmObj = NULL, method = "jaspar")
```

**Arguments**

assembly	genome assembly for which the motifs dissimilarity should be retrieved. Only the species information of the assembly is really relevant. Can be "vert" for all vertebrate motifs.
mmObj	optional motifmatchr object as returned by <code>ChrAccR::prepareMotifmatchr</code>
method	method of dissimilarity quantification. Currently only 'jaspar' (retrieve motif similarities from the annotation of the JASPAR website) is supported.

**Value**

a matrix of motif DISsimilarities (dist object)

**Author(s)**

Fabian Mueller

---

getMotifDistMat.jaspar	<i>getMotifDistMat.jaspar</i>
------------------------	-------------------------------

---

**Description**

Retrieve motif a comparison table from JASPAR annotation website and construct a dissimilarity matrix for given motif IDs

**Usage**

```
getMotifDistMat.jaspar(motifIds = NULL, scoreCol = "Ncor")
```

**Arguments**

motifIds	string vector of motif ids whose dissimilarities are retrieved
scoreCol	name of the annotation column in the JASPAR annotation that contains the motif similarity

**Value**

a matrix of motif DISsimilarities

---

getMotifEnrichment,DsATAC-method  
*getMotifEnrichment-methods*

---

**Description**

Perform enrichment analysis for (TF) motifs of a query set of regions. Fisher's Exact Test is employed to test the association of motif present in the query set against the background of all regions of that type covered in the object

**Usage**

```
## S4 method for signature 'DsATAC'  
getMotifEnrichment(.object, type, idx, motifs = "jaspar")
```

**Arguments**

.object	DsATAC object
type	character string specifying the region type
idx	logical vector or indices of the same length as length(getCoord(.object)) specifies the query set
motifs	either a character string (currently only "jaspar" and sets contained in chromVARmotifs ("homer", "encode", "cisbp") are supported) or an object containing PWMs that can be used by motifmatchr::matchMotifs (such as an PFMATRIXList or PWMATRIXList object)

**Value**

a data.frame summarizing Fisher's Exact Test enrichment statistics for each motif

**Author(s)**

Fabian Mueller

---

getMotifFootprints,DsATAC-method  
*getMotifFootprints-methods*

---

## Description

Perform enrichment analysis for (TF) motif footprinting

## Usage

```
## S4 method for signature 'DsATAC'  
getMotifFootprints(  
  .object,  
  motifNames,  
  samples = getSamples(.object),  
  motifFlank = 250L,  
  type = ".genome",  
  motifDb = "jaspar"  
)
```

## Arguments

<code>.object</code>	DsATAC object
<code>motifNames</code>	character vector of motif names
<code>samples</code>	sample identifiers
<code>motifFlank</code>	number of base pairs flanking the motif on each side
<code>type</code>	(PLACEHOLDER ARGUMENT: NOT IMPLEMENTED YET) character string specifying the region type or ".genome" (default) for genome-wide profiling
<code>motifDb</code>	either a character string (currently only "jaspar" and sets contained in <code>chromVARmotifs</code> ("homer", "encode", "cisbp") are supported) or an object containing PWMs that can be used by <code>motifmatchr::matchMotifs</code> (such as an <code>PFMatrixList</code> or <code>PWMMatrixList</code> object) OR a list of <code>GRanges</code> objects specifying motif occurrences

## Value

a list of footprinting results with one element for each motif. Each motif's results contain summary data frames with aggregated counts across all motif occurrences and a `ggplot` object for plotting footprints

## Author(s)

Fabian Mueller

## Examples

```
## Not run:
dsa <- ChrAccRex::loadExample("dsAtac_ia_example")
motifNames <- c("MA1419.1_IRF4", "MA0139.1_CTCF", "MA0037.3_GATA3")
# motifNames <- grep("(IRF4|CTCF|GATA3)$", names(prepareMotifmatchr("hg38", "jaspar")$motifs), value=TRUE, ignore.case=TRUE)
samples <- c("TeffNaive_U_1001", "TeffNaive_U_1002", "TeffMem_U_1001", "TeffMem_U_1002")
fps <- getMotifFootprints(dsa, motifNames, samples)
fps[["MA1419.1_IRF4"]]$plot

## End(Not run)
```

---

getMotifOccurrences    *getMotifOccurrences*

---

## Description

Find occurrences of motifs in a given genome

## Usage

```
getMotifOccurrences(motifNames = NULL, motifDb = "jaspar", genome = "hg38")
```

## Arguments

motifNames	character vector of motif names
motifDb	either a character string (currently only "jaspar" and sets contained in chromVARmotifs ("homer", "encode", "cisbp") are supported) or an object containing PWMs that can be used by motifmatchr::matchMotifs (such as an PFMATRIXLIST or PWMATRIXLIST object)
genome	character string specifying genome assembly

## Value

a GenomicRangesList containing motif occurrences

## Author(s)

Fabian Mueller

---

`getNonOverlappingByScore`*getNonOverlappingByScore*

---

**Description**

Retrieve the set of non-overlapping regions by iteratively picking the region with maximum score for each set of consecutively overlapping regions

**Usage**

```
getNonOverlappingByScore(gr, scoreCol = "score")
```

**Arguments**

<code>gr</code>	GRanges object
<code>scoreCol</code>	name of the column to be used as score in the <code>elementMetadata</code> of the <code>gr</code> object

**Value**

GRanges object containing non-overlapping regions

**Author(s)**

Fabian Mueller

---

`getNRegions,DsAcc-method`*getNRegions-methods*

---

**Description**

Return the number of regions of a given type

**Usage**

```
## S4 method for signature 'DsAcc'  
getNRegions(.object, type = "sites")
```

**Arguments**

<code>.object</code>	<code>DsAcc</code> object
<code>type</code>	character string specifying the region type or "sites" (default)

**Value**

the number of regions of that type

**Author(s)**

Fabian Mueller

---

```
getPeakSet.snakeATAC  getPeakSet.snakeATAC
```

---

**Description**

Retrieve a consensus set of ATAC peaks from the snakeATAC pipeline run

**Usage**

```
getPeakSet.snakeATAC(
  sampleAnnot,
  filePrefixCol,
  genome,
  dataDir,
  sampleIdCol = filePrefixCol,
  type = "summits_no_fw",
  unifWidth = 500L,
  replicateCol = NA,
  replicatePercReq = 1,
  replicateConsSelect = FALSE,
  keepOvInfo = FALSE
)
```

**Arguments**

sampleAnnot	data.frame specifying the sample annotation table
filePrefixCol	column name specifying the file prefix for each sample in the sample annotation table
genome	genome assembly
dataDir	directory where the files are located
sampleIdCol	column name or index in the sample annotation table containing unique sample identifiers
type	input data type. Currently only "summits_no_fw" (non-overlapping, fixed-width peaks deduced from summits)
unifWidth	width of the peaks if the results have uniform peak lengths
replicateCol	column name specifying the replicate group for cross-checking coverage across replicates

replicatePercReq	percentile of replicates in a group required to contain a peak in order to keep it. E.g. a value of 1 (default) means that all replicates in a group are required to contain that peak in order to keep it.
replicateConsSelect	if set, the peak set will also be checked for consistency, i.e. in order to retain a peak it has to be consistently be present or absent in each replicate group (as specified in replicatePercReq percent of samples)
keep0vInfo	keep annotation columns in the elementMetadata of the results specifying whether a consensus peak overlaps with a peak in each sample

**Value**

GRanges object containing consensus peak set

**Author(s)**

Fabian Mueller

---

*getQuickTssEnrichment,DsATAC-method*  
*getQuickTssEnrichment-methods*

---

**Description**

[Experimental] Quick, heuristic version of TSS enrichment to just get scores for each sample in the dataset. Useful, e.g. for single cells.

**Usage**

```
## S4 method for signature 'DsATAC'
getQuickTssEnrichment(
  .object,
  tssGr = NULL,
  sampleIds = getSamples(.object),
  tssW = 201L,
  distBg = 1900L
)
```

**Arguments**

.object	<a href="#">DsATAC</a> object
tssGr	GRanges object containing TSS coordinates
sampleIds	sampleIds for which TSS enrichment should be computed
tssW	width to consider around the TSS
distBg	number of bases flanking each TSS that will be added on each side

**Details**

Computes TSS enrichment as the ratio of total insertion sites at a window (of width `tssW` bp) directly at the TSS and 2 background regions symmetrically located (`distBg` bp) upstream and downstream of the TSS

**Value**

a vector of TSS enrichment values for each sample/cell in the dataset

**Author(s)**

Fabian Mueller

---

`getRegionMapping,DsNOMe-method`  
*getRegionMapping-methods*

---

**Description**

Retrieve a mapping from regions to GC indices in the dataset

**Usage**

```
## S4 method for signature 'DsNOMe'  
getRegionMapping(.object, type)
```

**Arguments**

<code>.object</code>	<code>DsNOMe</code> object
<code>type</code>	character string specifying a name for the region type

**Value**

list containing vectors of indices of GCs for each region of the specified type

**Author(s)**

Fabian Mueller

---

getRegionTypes,DsAcc-method  
*getRegionTypes-methods*

---

**Description**

Return sample IDs in a dataset

**Usage**

```
## S4 method for signature 'DsAcc'  
getRegionTypes(.object, inclSites = FALSE)
```

**Arguments**

.object            [DsAcc](#) object  
inclSites        include "sites" in the result

**Value**

Character vector of sample IDs in the dataset

**Author(s)**

Fabian Mueller

---

getSampleAnnot,DsAcc-method  
*getSampleAnnot-methods*

---

**Description**

Return sample annotation table of a dataset

**Usage**

```
## S4 method for signature 'DsAcc'  
getSampleAnnot(.object)
```

**Arguments**

.object            [DsAcc](#) object

**Value**

data.frame containing sample annotation

**Author(s)**

Fabian Mueller

---

`getSampleMetrics.snakeATAC`  
*getSampleMetrics.snakeATAC*

---

**Description**

Retrieve sample summary statistics from the output a snakeATAC pipeline run

**Usage**

```
getSampleMetrics.snakeATAC(sampleAnnot, snakeDir, withPeaks = TRUE)
```

**Arguments**

<code>sampleAnnot</code>	data.frame specifying the sample annotation table. Must have valid rownames corresponding to the sample ids used in the snakeAtac filenames
<code>snakeDir</code>	snakeATAC base directory (where the files are located)
<code>withPeaks</code>	flag indicating whether to output peak statistics

**Value**

data.frame containing sample summary statistics. the original sample annotation table will be appended to the summary output

**Author(s)**

Fabian Mueller

---

`getSamples.DsAcc-method`  
*getSamples-methods*

---

**Description**

Return sample IDs in a dataset

**Usage**

```
## S4 method for signature 'DsAcc'  
getSamples(.object)
```

**Arguments**

.object      [DsAcc](#) object

**Value**

Character vector of sample IDs in the dataset

**Author(s)**

Fabian Mueller

---

getScQcStatsTab,DsATACsc-method  
*getScQcStatsTab-methods*

---

**Description**

Retrieve a table of QC statistics for single cells

**Usage**

```
## S4 method for signature 'DsATACsc'  
getScQcStatsTab(.object)
```

**Arguments**

.object      [DsATACsc](#) object

**Value**

an `data.frame` contain QC statistics for each cell

**Author(s)**

Fabian Mueller

---

`getTfAnnot`*getTfAnnot*

---

**Description**

retrieve TF annotation data

**Usage**

```
getTfAnnot(type = "humantfs")
```

**Arguments**

`type` annotation type. Currently only "humantfs" (pulls info from humantfs.ccb.utoronto.ca) is supported

**Value**

a data frame of TF annotation

**Author(s)**

Fabian Mueller

---

`getTssEnrichment, DsATAC-method`*getTssEnrichment-methods*

---

**Description**

Get TSS enrichment data and plot

**Usage**

```
## S4 method for signature 'DsATAC'  
getTssEnrichment(  
  .object,  
  sampleId,  
  tssGr = NULL,  
  flank = 2000L,  
  normTailW = 100L,  
  smoothW = 25L,  
  silent = FALSE  
)
```

**Arguments**

<code>.object</code>	DsATAC object
<code>sampleId</code>	sample to be plotted
<code>tssGr</code>	GRanges object containing TSS coordinates or NULL to get default set from annotation package
<code>flank</code>	number of bases flanking each TSS that will be added on each side
<code>normTailW</code>	number of bases on each side whose counts will be used to normalize the data
<code>smoothW</code>	radius of the window (in bp) that will be used to smooth the data, i.e. the total width of the smoothing window will be twice that number
<code>silent</code>	limit log messages

**Value**

a list containing TSS enrichment data and a ggplot object containing TSS enrichment plot

**Author(s)**

Fabian Mueller

---

`getTssEnrichmentBatch,DsATAC-method`  
*getTssEnrichmentBatch-methods*

---

**Description**

Get TSS enrichment data and plot

**Usage**

```
## S4 method for signature 'DsATAC'  
getTssEnrichmentBatch(  
  .object,  
  tssGr = NULL,  
  sampleIds = getSamples(.object),  
  tssW = 201L,  
  flank = 2000L,  
  normTailW = 200L,  
  smoothW = 51L  
)
```

**Arguments**

.object	DsATAC object
tssGr	GRanges object containing TSS coordinates or NULL to get default set from annotation package
sampleIds	sampleIds for which TSS enrichment should be computed
tssW	size of the core TSS window
flank	number of bases flanking each TSS that will be added on each side
normTailW	number of bases on each side whose counts will be used to normalize the data
smoothW	diameter of the window (in bp) that will be used to smooth the data

**Value**

a list containing TSS enrichment data

**Author(s)**

Fabian Mueller

---

hmSeqLogo

*hmSeqLogo*

---

**Description**

Draw a sequence motif logo in a Complex Heatmap using grid. adapted from seqLogo::seqLogo()

**Usage**

```
hmSeqLogo(
  pwm,
  x = unit(0.5, "npc"),
  y = unit(0.5, "npc"),
  width = 1,
  height = 1,
  ic.scale = TRUE
)
```

**Arguments**

pwm	PWM (from TFBSTools package)
x	x center coordinate where the motif should be drawn
y	y center coordinate where the motif should be drawn
width	drawing width
height	drawing height
ic.scale	logical If TRUE, the height of each column is proportional to its information content. Otherwise, all columns have the same height.

**Value**

Draws the motif

**Author(s)**

Fabian Mueller

**Examples**

```
## Not run:  
mm <- prepareMotifmatchr("hg38", "jaspar")$motifs[["MA0137.3_STAT1"]]  
hmSeqLogo(mm, unit(0.5, "npc"), unit(0.5, "npc"), 0.5, 0.5, ic.scale=TRUE)  
  
## End(Not run)
```

---

<code>isCanonicalChrom</code>	<i>isCanonicalChrom</i>
-------------------------------	-------------------------

---

**Description**

for a character string of chromosome names, determine if it is a canonical chromosome (i.e. not not ChrUn\*, \*\_random, ...)

**Usage**

```
isCanonicalChrom(ss)
```

**Arguments**

ss                    character vector of chromosome names

**Value**

logical vector stating whether the given chromosome names correspond to canonical chromosomes

**Author(s)**

Fabian Mueller

---

```
iterativeLSI,DsATACsc-method
      iterativeLSI-methods
```

---

## Description

Perform iterative LSI clustering and dimension reduction as described in doi:10.1038/s41587-019-0332-7

## Usage

```
## S4 method for signature 'DsATACsc'
iterativeLSI(
  .object,
  it0regionType = "t5k",
  it0nMostAcc = 20000L,
  it0pcs = 1:25,
  it0clusterResolution = 0.8,
  it0clusterMinCells = 200L,
  it0nTopPeaksPerCluster = 2e+05,
  it1pcs = 1:50,
  it1clusterResolution = 0.8,
  it1mostVarPeaks = 50000L,
  it2pcs = 1:50,
  it2clusterResolution = 0.8,
  rmDepthCor = 0.5,
  normPcs = FALSE,
  umapParams = list(distMethod = "euclidean", min_dist = 0.5, n_neighbors = 25)
)
```

## Arguments

<code>.object</code>	<a href="#">DsATACsc</a> object
<code>it0regionType</code>	character string specifying the region type to start with
<code>it0nMostAcc</code>	the number of the most accessible regions to consider in iteration 0
<code>it0pcs</code>	the principal components to consider in iteration 0
<code>it0clusterResolution</code>	resolution paramter for Seurat's clustering ( <code>Seurat::FindClusters</code> ) in iteration 0
<code>it0clusterMinCells</code>	the minimum number of cells in a cluster in order for it to be considered in peak calling (iteration 0)
<code>it0nTopPeaksPerCluster</code>	the number of best peaks to be considered for each cluster in the merged peak set (iteration 0)

<code>it1pcs</code>	the principal components to consider in iteration 0
<code>it1clusterResolution</code>	resolution paramter for Seurat's clustering ( <code>Seurat::FindClusters</code> ) in iteration 1
<code>it1mostVarPeaks</code>	the number of the most variable peaks to consider after iteration 1
<code>it2pcs</code>	the principal components to consider in the final iteration (2)
<code>it2clusterResolution</code>	resolution paramter for Seurat's clustering ( <code>Seurat::FindClusters</code> ) in the final iteration (2)
<code>rmDepthCor</code>	correlation cutoff to be used to discard principal components associated with fragment depth (all iterationa)
<code>normPcs</code>	flag indicating whether to apply z-score normalization to PCs for each cell (all iterations)
<code>umapParams</code>	parameters to compute UMAP coordinates (passed on to <code>muRtools::getDimRedCoords.umap</code> and further to <code>uwot::umap</code> )

## Details

In order to obtain a low dimensional representation of single-cell ATAC datasets in terms of principal components and UMAP coordinates, we recommend an iterative application of the Latent Semantic Indexing approach [10.1016/j.cell.2018.06.052] described in [doi:10.1038/s41587-019-0332-7]. This approach also identifies cell clusters and a peak set that represents a consensus peak set of cluster peaks in a given dataset. In brief, in an initial iteration clusters are identified based on the most accessible regions (e.g. genomic tiling regions). Here, the counts are first normalized using the term frequency–inverse document frequency (TF-IDF) transformation and singular values are computed based on these normalized counts in selected regions (i.e. the most accessible regions in the initial iteration). Clusters are identified based on the singular values using Louvain clustering (as implemented in the Seurat package). Peak calling is then performed on the aggregated insertion sites from all cells of each cluster (using MACS2) and a union/consensus set of peaks uniform-length non-overlapping peaks is selected. In a second iteration, the peak regions whose TF-IDF-normalized counts which exhibit the most variability across the initial clusters provide the basis for a refined clustering using derived singular values. In the final iteration, the most variable peaks across the refined clusters are identified as the final peak set and singular values are computed again. Based on these final singular values UMAP coordinates are computed for low-dimensional projection.

The output object includes the final singular values/principal components (`result$pcaCoord`), the low-dimensional coordinates (`result$umapCoord`), the final cluster assignment of all cells (`result$clustAss`), the complete, unfiltered initial cluster peak set (`result$clusterPeaks_unfiltered`) as well as the final cluster-variable peak set (`result$regionGr`).

## Value

an S3 object containing dimensionality reduction results, peak sets and clustering

## Author(s)

Fabian Mueller

---

join,DsATAC-method     *join-methods*

---

### Description

Combine two [DsATAC](#) objects

### Usage

```
## S4 method for signature 'DsATAC'  
join(.object, objectB, joinRegionTypes = "union")
```

### Arguments

.object             [DsATAC](#) object  
objectB             [DsATAC](#) object  
combineRegionTypes  
                    how to combine region types: 'union' (default): the resulting object will have counts aggregated over region types from both objects. 'intersect': only region types present in both objects will occur in the output

### Value

a new [DsATAC](#) object combining both input objects. It contains untransformed counts.

### Author(s)

Fabian Mueller

---

length,DsAcc-method     *Retrieve the number of samples contained in a DsAcc object*

---

### Description

Retrieve the number of samples contained in a [DsAcc](#) object

### Usage

```
## S4 method for signature 'DsAcc'  
length(x)
```

### Arguments

x                    [DsAcc](#) object

---

loadConfig	<i>loadConfig</i>
------------	-------------------

---

**Description**

Sets the configuration from a configuration file (JSON)

**Usage**

```
loadConfig(cfgFile)
```

**Arguments**

cfgFile            Config file in JSON format. As output by [saveConfig](#)

**Value**

nothing of particular interest. The configuration is set for the current environment

**Author(s)**

Fabian Mueller

---

loadDsAcc	<i>loadDsAcc</i>
-----------	------------------

---

**Description**

Load a DsAcc dataset from disk

**Usage**

```
loadDsAcc(path)
```

**Arguments**

path                Location of saved [DsAcc](#) object

**Value**

[DsAcc](#) object

**Author(s)**

Fabian Mueller

---

 maskMethNA,DsNOMe-method

*maskMethNA-methods*

---

**Description**

Set the indices specified in a mask to NA

**Usage**

```
## S4 method for signature 'DsNOMe'
maskMethNA(.object, mask, type = "sites", reaggregate = TRUE)
```

**Arguments**

.object	DsNOMe object
mask	a mask, i.e. a logical matrix of indices to set to NA
type	character string specifying a name for the region type (default: sites)
reaggregate	redo region aggregation (only has an effect if type is sites and there are aggregated regions in the dataset)

**Value**

a new DsNOMe object with sites/regions masked

**Author(s)**

Fabian Mueller

---

 mergePseudoBulk,DsATACsc-method

*mergePseudoBulk-methods*

---

**Description**

Merge cells into pseudobulk samples based on annotation

**Usage**

```
## S4 method for signature 'DsATACsc'
mergePseudoBulk(.object, mergeGroups, cleanSampleAnnot = TRUE)
```

**Arguments**

<code>.object</code>	<code>DsATACsc</code> object
<code>mergeGroups</code>	factor or character vector or column name in sample annotation table. Can alternatively be a (named) list containing sample indices or names for each group to merge.
<code>cleanSampleAnnot</code>	clean up sample annotation table in the new object

**Value**

a new `DsATAC` object with cells merged into pseudobulk samples

**Author(s)**

Fabian Mueller

---

`mergeSamples,DsATAC-method`  
*mergeSamples-methods*

---

**Description**

Merge signal and insertion data across samples

**Usage**

```
## S4 method for signature 'DsATAC'  
mergeSamples(.object, mergeGroups, countAggrFun = "sum")
```

**Arguments**

<code>.object</code>	<code>DsATAC</code> object
<code>mergeGroups</code>	factor or character vector or column name in sample annotation table. Can alternatively be a (named) list containing sample indices or names for each group to merge.
<code>countAggrFun</code>	aggregation function for signal counts. Currently <code>sum</code> (default), <code>mean</code> and <code>median</code> are supported.

**Value**

a new `DsATAC` object with samples merged

**Author(s)**

Fabian Mueller

---

mergeStrands,DsNOMe-method  
*mergeStrands-methods*

---

**Description**

Merge + and - strands of the dataset by adding read coverage and recomputing Methylation levels

**Usage**

```
## S4 method for signature 'DsNOMe'  
mergeStrands(.object, reaggregate = TRUE)
```

**Arguments**

.object	DsNOMe object
reaggregate	redo region aggregation (only has an effect if there are aggregated regions in the dataset)

**Value**

a new DsNOMe object with the strands merged

**Author(s)**

Fabian Mueller

---

normalizeMeth,DsNOMe-method  
*normalizeMeth-methods*

---

**Description**

Normalize methylation levels

**Usage**

```
## S4 method for signature 'DsNOMe'  
normalizeMeth(.object, type = "sites", method = "quantile", reaggregate = TRUE)
```

**Arguments**

.object	DsNOMe object
type	character string specifying a name for the region type (default: sites)
method	normalization method to be applied. Currently only 'quantile' is supported
reaggregate	redo region aggregation (only has an effect if type is sites and there are aggregated regions in the dataset)

**Value**

a new `DsNOME` object with normalized methylation levels

**Author(s)**

Fabian Mueller

---

plotInsertSizeDistribution, DsATAC-method  
*plotInsertSizeDistribution-methods*

---

**Description**

Plot insert size distribution

**Usage**

```
## S4 method for signature 'DsATAC'  
plotInsertSizeDistribution(.object, sampleId)
```

**Arguments**

<code>.object</code>	<code>DsATAC</code> object
<code>sampleId</code>	sample to be plotted

**Value**

ggplot object containing insert size distribution plot

**Author(s)**

Fabian Mueller

---

prepareMotifmatchr     *prepareMotifmatchr*

---

**Description**

prepare objects for a motifmatchr analysis

**Usage**

```
prepareMotifmatchr(genome, motifs)
```

**Arguments**

genome	character string specifying genome assembly
motifs	either a character string (currently only "jaspar" and sets contained in chromVARmotifs ("homer", "encode", "cisbp") are supported) or an object containing PWMs that can be used by motifmatchr::matchMotifs (such as an PFMATRIXList or PWMATRIXList object)

**Value**

a list containing objects to be used as arguments for motifmatchr

**Author(s)**

Fabian Mueller

---

projectMatrix\_UMAP     *projectMatrix\_UMAP*

---

**Description**

given a (count) matrix and dimension reduction result, return the projected UMAP coordinates in the embedding space

**Usage**

```
projectMatrix_UMAP(X, umapObj, binarize = TRUE, addPcCoord = FALSE)
```

**Arguments**

X	matrix to be projected (features X samples)
umapObj	dimension reduction result as returned by <a href="#">dimRed_UMAP</a>
binarize	binarize the counts before projecting
addPcCoord	also add PC coordinates to the resulting matrix

**Value**

Projected UMAP coordinates

**Author(s)**

Fabian Mueller

---

PWMMatrixToProbMatrix    *PWMMatrixToProbMatrix*

---

**Description**

convert a log2probratio PWM (PWMMatrix from TFBSTools package) to a matrix containing probabilities in [0,1]

**Usage**

PWMMatrixToProbMatrix(x)

**Arguments**

x                      log2probratio PWM (PWMMatrix from TFBSTools package)

**Value**

PWM probability matrix with values in

**Author(s)**

Fabian Mueller

---

readMACS2peakFile    *readMACS2peakFile*

---

**Description**

Reads the MACS2 output as GRanges

**Usage**

readMACS2peakFile(fn)

**Arguments**

fn                      Filename for MACS2 narrow peak file

**Value**

GRanges object containing peak information

**Author(s)**

Fabian Mueller

---

```
regionAggregation,DsATAC-method
      regionAggregation-methods
```

---

## Description

Aggregate signal counts across a set of regions

## Usage

```
## S4 method for signature 'DsATAC'
regionAggregation(
  .object,
  regGr,
  type,
  signal = NULL,
  aggrFun = "median",
  dropEmpty = TRUE,
  bySample = TRUE,
  chunkSize = 5000L
)
```

## Arguments

<code>.object</code>	<a href="#">DsATAC</a> object
<code>regGr</code>	<code>GRanges</code> object containing regions to summarize
<code>type</code>	character string specifying a name for the region type
<code>signal</code>	character string specifying a name for the region type for the signal to be aggregated. If it is <code>NULL</code> (default), the new region type will be initialized with <code>NA</code> values. If it is <code>"insertions"</code> count data will be initialized from insertion sites (if fragment data is present in the object).
<code>aggrFun</code>	aggregation function for signal counts. Will only be used if <code>signal!="insertions"</code> . Currently <code>sum</code> , <code>mean</code> and <code>median</code> (default) are supported.
<code>dropEmpty</code>	discard all regions with no observed signal counts
<code>bySample</code>	[only relevant if <code>signal=="insertions"</code> ]. Process data sample-by-sample to save memory.
<code>chunkSize</code>	[only relevant if <code>signal=="insertions" &amp; !bySample</code> ] number of samples to process per chunk (saves memory). If <code>NULL</code> or larger than the number of samples, only one chunk will be processed.

## Value

a new [DsATAC](#) object with aggregated signal counts per regions

**Author(s)**

Fabian Mueller

---

regionAggregation,DsNOMe-method  
*regionAggregation-methods*

---

**Description**

Aggregate methylation levels and coverage values across a set of regions

**Usage**

```
## S4 method for signature 'DsNOMe'  
regionAggregation(  
  .object,  
  regGr,  
  type,  
  methAggrFun = "weightedMean",  
  dropEmpty = TRUE  
)
```

**Arguments**

.object	DsNOMe object
regGr	GRanges object containing regions to summarize
type	character string specifying a name for the region type
methAggrFun	aggregation function for methylation levels. Currently mean, median and weightedMean (default) are supported.
dropEmpty	discard all regions with no observed methylation levels

**Details**

Coverage values are aggregated by summing up coverage values for individual GCs while the aggregation function for methylation levels is specified by the methAggrFun parameter.

**Value**

a new DsNOMe object with aggregated regions

**Author(s)**

Fabian Mueller

---

regionSetCounts,DsATAC-method  
*regionSetCounts-methods*

---

**Description**

Overlap the insertion data with a list of region sets

**Usage**

```
## S4 method for signature 'DsATAC'  
regionSetCounts(.object, rs1, bySample = FALSE)
```

**Arguments**

.object	DsATAC object
rs1	GRangesList or NAMED list of GRanges objects. Each element corresponds to a region set for which the summary statistics are reported
bySample	for internal use: iterate over samples (instead of retrieving one giant insertion list for all samples) in order to save memory (at the tradeoff of compute time)

**Value**

a matrix of overlap counts for each region set and sample

**Author(s)**

Fabian Mueller

---

removeFragmentData,DsATAC-method  
*removeFragmentData-methods*

---

**Description**

Removes fragment data from DsATAC object (e.g. to save space)

**Usage**

```
## S4 method for signature 'DsATAC'  
removeFragmentData(object)
```

**Arguments**

object	DsATAC object
--------	---------------

**Value**

the modified object (without fragment data)

**Author(s)**

Fabian Mueller

---

removeRegionData,DsATAC-method  
*removeRegionData-methods*

---

**Description**

Remove all region data from a [DsATAC](#) object

**Usage**

```
## S4 method for signature 'DsATAC'  
removeRegionData(.object)
```

**Arguments**

.object            [DsATAC](#) object

**Value**

a new [DsATAC](#) object with region data removed

**Author(s)**

Fabian Mueller

---

removeRegions,DsAcc-method  
*removeRegions-methods*

---

**Description**

Remove the specified sites or regions from an object

**Usage**

```
## S4 method for signature 'DsAcc'  
removeRegions(.object, indices, type)
```

**Arguments**

.object	DsAcc object
indices	a vector of indices of sites/regions to be removed. Can be numeric, integer or logical.
type	character string specifying a name for the region type (sefault: sites)

**Value**

a new DsAcc object with sites/regions removed

**Author(s)**

Fabian Mueller

---

removeRegions,DsATAC-method  
*removeRegions-methods*

---

**Description**

Remove the specified sites or regions from an object

**Usage**

```
## S4 method for signature 'DsATAC'  
removeRegions(.object, indices, type)
```

**Arguments**

.object	DsATAC object
indices	a vector of indices of sites/regions to be removed. Can be numeric, integer or logical.
type	character string specifying a name for the region type (sefault: sites)

**Value**

a new DsATAC object with sites/regions removed

**Author(s)**

Fabian Mueller

---

removeRegions,DsNOME-method  
*removeRegions-methods*

---

**Description**

Remove the specified sites or regions from an object

**Usage**

```
## S4 method for signature 'DsNOME'  
removeRegions(.object, indices, type = "sites", reaggregate = TRUE)
```

**Arguments**

.object	DsNOME object
indices	a vector of indices of sites/regions to be removed. Can be numeric, integer or logical.
type	character string specifying a name for the region type (sefault: sites)
reaggregate	redo region aggregation (only has an effect if type is sites and there are aggregated regions in the dataset)

**Value**

a new DsNOME object with sites/regions removed

**Author(s)**

Fabian Mueller

---

removeRegionType,DsATAC-method  
*removeRegionType-methods*

---

**Description**

Remove the specified region type from an object

**Usage**

```
## S4 method for signature 'DsATAC'  
removeRegionType(.object, type)
```

**Arguments**

.object        [DsATAC](#) object  
type            character string specifying a name for the region type (sefault: sites)

**Value**

a new [DsATAC](#) object with the region type removed

**Author(s)**

Fabian Mueller

---

*removeSamples,DsATAC-method*  
*removeSamples-methods*

---

**Description**

Remove samples from a [DsATAC](#) object

**Usage**

```
## S4 method for signature 'DsATAC'  
removeSamples(.object, indices)
```

**Arguments**

.object        [DsATAC](#) object  
indices        a vector of indices of samples to be removed. Can be numeric, integer or logical.

**Value**

a new [DsATAC](#) object with sites/regions removed

**Author(s)**

Fabian Mueller

---

rowZscores	<i>rowZscores</i>
------------	-------------------

---

**Description**

Performs z-score normalization on the rows of a matrix. (Basically a wrapper around `matrixStats`)

**Usage**

```
rowZscores(X, na.rm = FALSE)
```

**Arguments**

X	input matrix
na.rm	should NAs be omitted?

**Value**

z-score normalized matrix

**Author(s)**

Fabian Mueller

---

run_atac	<i>run_atac</i>
----------	-----------------

---

**Description**

Run the complete ChrAccR analysis for ATAC-seq data

**Usage**

```
run_atac(  
  anaDir,  
  input = NULL,  
  sampleAnnot = NULL,  
  genome = NULL,  
  sampleIdCol = NULL,  
  regionSets = NULL,  
  startStage = "raw",  
  resetStage = NULL  
)
```

**Arguments**

anaDir	analysis directory
input	Input object. Can be either NULL, a character string, a DsATAC. Set to NULL when you want to continue a previous analysis
sampleAnnot	sample annotation table (data.frame) or NULL if continuing existing analysis or input is a DsATAC object
genome	genome assembly. Only relevant if not continuing existing analysis and input is not a DsATAC object
sampleIdCol	column name in the sample annotation table containing unique sample Only relevant if not continuing existing analysis and input is not a DsATAC object
regionSets	a list of GRanges objects which contain region sets over which count data will be aggregated. Only relevant if not continuing existing analysis and input is not a DsATAC object
startStage	stage where to start the analysis from. can be one of "raw", "filtered", "processed". Only relevant if not continuing existing analysis.
resetStage	flag indicating whether to reset the analysis directory (i.e. deleting previously generated reports and datasets), when continuing previous analyses (input argument is NULL).

**Value**

DsATAC object (invisible)

**Author(s)**

Fabian Mueller

---

run\_atac\_chromvar      *run\_atac\_chromvar*

---

**Description**

Run chromVAR analysis for ATAC-seq data

**Usage**

```
run_atac_chromvar(.object)
```

**Arguments**

.object      DsATAC object

**Value**

An S3 object containing a list of chromVAR Deviations objects as returned by `chromVAR::computeDeviations`. One object for each region type specified in the `chromVarRegionTypes` configuration.

**Author(s)**

Fabian Mueller

---

`run_atac_differential` *run\_atac\_differential*

---

**Description**

Run differential analyses for ATAC-seq data

**Usage**`run_atac_differential(dsa, anaDir, chromVarObj = NULL)`**Arguments**

<code>dsa</code>	DsATAC object
<code>anaDir</code>	analysis directory
<code>chromVarObj</code>	[optional] pre-computed result of a call to <code>run_atac_chromvar(...)</code>

**Value**

S3 object containing differential analysis results and an analysis report object

**Author(s)**

Fabian Mueller

---

`run_atac_exploratory` *run\_atac\_exploratory*

---

**Description**

Run exploratory analyses for ATAC-seq data

**Usage**

```
run_atac_exploratory(  
  dsa,  
  anaDir,  
  chromVarObj = NULL,  
  itLsiObj = NULL,  
  geneActSe = NULL  
)
```

**Arguments**

dsa	DsATAC object
anaDir	analysis directory
chromVarObj	[optional] pre-computed result of a call to run_atac_chromvar(...)
itLsiObj	[for single-cell only; optional] pre-computed result of a call to iterativeLSI(.object, ...)
geneActSe	[for single-cell only; optional] pre-computed result of a call to getCiceroGeneActivities(.object, ...)

**Value**

S3 object containing exploratory metrics and an analysis report object

**Author(s)**

Fabian Mueller

---

run\_atac\_filtering     *run\_atac\_filtering*

---

**Description**

Run the filtering for ATAC-seq data

**Usage**

```
run_atac_filtering(dsa, anaDir)
```

**Arguments**

dsa	DsATAC object
anaDir	analysis directory

**Value**

S3 object containing the filtered DsATAC object, filtering statistics and an analysis report object

**Author(s)**

Fabian Mueller

run\_atac\_normalization  
*run\_atac\_normalization*

---

**Description**

Run count normalization for ATAC-seq data

**Usage**

```
run_atac_normalization(dsa, anaDir)
```

**Arguments**

dsa	DsATAC object
anaDir	analysis directory

**Value**

S3 object containing the normalized DsATAC object and an analysis report object

**Author(s)**

Fabian Mueller

---

run\_atac\_peakcalling *run\_atac\_peakcalling*

---

**Description**

Run peak calling for ATAC-seq data

**Usage**

```
run_atac_peakcalling(dsa, anaDir)
```

**Arguments**

dsa	DsATAC object
anaDir	analysis directory

**Value**

S3 object containing the annotated DsATAC object, per-sample peak calls, a consensus peak set and an analysis report object

**Author(s)**

Fabian Mueller

---

run\_atac\_qc                      *run\_atac\_qc*

---

**Description**

Run the summary QC analysis for ATAC-seq data

**Usage**

run\_atac\_qc(dsa, anaDir)

**Arguments**

dsa                      [DsATAC](#) object  
anaDir                      analysis directory

**Value**

S3 object containing QC statistics and an analysis report object

**Author(s)**

Fabian Mueller

---

run\_atac\_sc\_unsupervised  
*run\_atac\_sc\_unsupervised*

---

**Description**

Run unsupervised analysis for single-cell ATAC-seq data (i.e. iterative LSI, clustering and cluster peak detection)

**Usage**

run\_atac\_sc\_unsupervised(dsa, anaDir)

**Arguments**

dsa                      [DsATAC](#) object  
anaDir                      analysis directory

**Value**

S3 object containing the annotated [DsATAC](#) object, the results of running iterative LSI and an analysis report object

**Author(s)**

Fabian Mueller

---

safeMatrixStats	<i>safeMatrixStats</i>
-----------------	------------------------

---

**Description**

Compute matrix statistics selecting the appropriate function depending on the matrix class of the input (supports sparse matrices and DelayedArrays)

**Usage**

```
safeMatrixStats(X, statFun = "rowSums", ...)
```

**Arguments**

X	input matrix
statFun	statistic. E.g. "rowSums", "colSums", "rowMeans", "colMeans", ...
...	arguments passed on to the matrix stats function. E.g. na.rm.

**Value**

result of the corresponding matrix statistic

**Author(s)**

Fabian Mueller

---

```
samplePseudoBulk,DsATACsc-method  
    samplePseudoBulk-methods
```

---

## Description

Samples pseudo-bulk samples from single-cells

## Usage

```
## S4 method for signature 'DsATACsc'  
samplePseudoBulk(.object, nnData, nSamples, nCellsPerSample = 100)
```

## Arguments

.object	<a href="#">DsATACsc</a> object
nnData	Data to use for nearest neighbor matching. Can either be the name of a region type in .object or a data matrix with the same number of rows as .object has cells.
nSamples	number of pseudobulk samples to be returned
nCellsPerSample	number of cells to be aggregated per sample

## Details

Samples pseudo-bulk samples from single-cells by sampling `nSamples` individual cells and then merging it with its `nCellsPerSample - 1` nearest neighbors (according to `nnData`).

## Value

S3 data structure containing a list of sampling results as well as a [DsATAC](#) object containing pseudo-bulk aggregates

## Author(s)

Fabian Mueller

---

saveConfig	<i>saveConfig</i>
------------	-------------------

---

**Description**

Save the current configuration to a configuration file (JSON)

**Usage**

```
saveConfig(dest)
```

**Arguments**

dest	Filename for the config file in JSON format.
------	--

**Value**

nothing of particular interest.

**Author(s)**

Fabian Mueller

---

saveDsAcc	<i>saveDsAcc</i>
-----------	------------------

---

**Description**

Save a DsAcc dataset to disk for later loading

**Usage**

```
saveDsAcc(.object, path, forceDiskDump = FALSE, updateDiskRef = TRUE)
```

**Arguments**

.object	DsAcc object
path	destination to save the object to
forceDiskDump	force large matrices (counts) to be stored as HDF5 (even when the object was not created using diskDump=TRUE)
updateDiskRef	update disk dumped (HDF5) references (e.g. for count data)

**Value**

(invisibly) The object (with potentially updated disk dumped references)

**Author(s)**

Fabian Mueller

---

 setConfigElement      *setConfigElement*

---

**Description**

Set a configuration item to a given value

**Usage**

setConfigElement(name, value)

**Arguments**

name	name of the config item
value	value of the config item

**Value**

nothing of particular interest.

**Options used by the package**

tmpDir = tempdir() Directory for temporary files. Must be existing.

cleanMem = TRUE During runtime, regularly clean-out the memory in order to reduce memory overuse

colorSchemes named list of DISCRETE color schemes to be used for plotting. Each element should be a named vector specifying colors for groups/annotations.

colorSchemesCont named list of CONTINUOUS color schemes to be used for plotting. Each element should be a vector specifying a range of colors.

geneModelVersions Gene model versions to be used for various genomes

analysisName = "ChrAccR analysis" A title for the analysis (a string).

regionTypes Region types to be used in the analysis

chromVarRegionTypes = NULL Region types to be used for chromVar analysis. If NULL (default), ChrAccR will automatically look for region types with the keyword "peak" in their name.

chromVarMotifs = "jaspar\_vert" Character vector of names of TF motif sets to be used in ChromVAR analyses. By default the vertebrate set of the JASPAR database will be used.

chromVarMotifNamesForDimRed Names of motifs to be used for dimension reduction plots in the reports. [only relevant for single-cell data]

genesOfInterest Names of genes of interest to be highlighted in the reports (e.g. dimension reduction) in the reports. [currently only relevant for single-cell data and only when scGeneActivity is activated]

`annotationColumns` Sample annotation columns to be used for reporting  
`annotationMinGroupSize = 2` Minimum size of a group to be used in the reports. Influences which annotation columns are automatically selected for reporting.  
`annotationMaxGroupCount = NULL` Maximum number of groups to be used in the reports. Influences which annotation columns are automatically selected for reporting. If NULL (default) it will effectively be the number of samples - 1.  
`doPeakCalling = FALSE` Perform per-sample peak calling and retrieve consensus peak set. Requires that macs2 is installed and can be called from the command line. [for bulk data analysis only]  
`peakCallingProfile = NULL` If set to a string describing a valid profile, will apply a special profile for macs2 peak calling. [only valid in combination with the `doPeakCalling` option]  
`annotationPeakGroupColumn` Annotation column to base the consensus peak set replication filtering on.  
`annotationPeakGroupAgreePerc = 1.0` Percent of samples that have to agree to identify consensus peaks. See [getConsensusPeakSet](#) for details.  
`filteringCovgCount = 1L` Minimum insertion count to filter count matrices by. See [filterLowCovg, DsATAC-method](#) for details. [for bulk data analysis only]  
`filteringCovgReqSamples = 0.75` Minimum required samples to apply low coverage filtering to. See [filterLowCovg, DsATAC-method](#) for details. [for bulk data analysis only]  
`filteringSexChroms = FALSE` Flag indicating whether to remove sex chromosomes.  
`filteringScMinFragmentsPerCell = 1000L` Minimum number of fragments per cell to retain a cell in the analysis. [for single-cell data analysis only]  
`filteringScMaxFragmentsPerCell = Inf` Maximum number of fragments allowed per cell to retain a cell in the analysis. [for single-cell data analysis only]  
`filteringScMinTssEnrichment = 6` Minimum TSS enrichment score per cell to retain a cell in the analysis. [for single-cell data analysis only]  
`normalizationMethod = "quantile"` Normalization method to use for count normalization. Allowed methods include the ones listed in [transformCounts, DsATAC-method](#). [for bulk data analysis only]  
`exploratoryLogNormCounts = TRUE` Should a log-normalization be applied in the exploratory plot sections of the reports (dimension reduction, heatmaps)  
`exploratoryNSubsample = 2e6` Number of regions to subsample in exploratory analysis in order to increase computational performance.  
`differentialColumns` Sample annotation columns to be used for differential testing and reporting  
`differentialColumns1vsAll` Sample annotation columns to be used for differential testing and reporting in a 1-vs-all group setting. Should be a subset of `differentialColumns`.  
`differentialCompNames` Comparison names from which comparison information is derived. Must be in the format of "\$GRP1\_NAME vs \$GRP2\_NAME [\$ANNOTATION\_COLUMN]".  
`differentialAdjColumns` Sample annotation columns to be adjusted for in differential testing  
`differentialCutoffFL2FC` Cutoff on log2 fold-change to be used for reporting differential accessibility.  
`lolaDbPaths` Precomputed LOLA databases to be used for enrichment analysis. If NULL (default), `ChrAccR` will download an appropriate core database.

scIterativeLsiRegType For single-cell analysis only: region type to be used for clustering and dimension reduction using iterative LSI. By default (NULL), ChrAccR will look for a region type named "tiling".

scIterativeLsiParams Parameters to use for iterative LSI. See [iterativeLSI,DsATACsc-method](#) for details.

scGeneActivity = FALSE For single-cell analysis only: Compute gene activity from accessibility. Possible options are "RBF" for radial-basis-function-weighted count aggregation (default when set to TRUE) or "Cicero" for Cicero correlation-based aggregation

### Author(s)

Fabian Mueller

---

transformCounts,DsATAC-method  
*transformCounts-methods*

---

### Description

transform count data for an ATAC seq dataset

### Usage

```
## S4 method for signature 'DsATAC'
transformCounts(
  .object,
  method = "quantile",
  regionTypes = getRegionTypes(.object),
  ...
)
```

### Arguments

.object	<a href="#">DsATAC</a> object
method	transformation method to be applied. Currently only 'log2', 'log10', 'quantile' (quantile normalization), 'percentile' (percentile normalization), 'rankPerc' (rank percentile), 'vst' (DESeq2 Variance Stabilizing Transformation), 'batchCorrect' (limma batch effect removal), 'tf-idf', 'CPM' (counts per million), and 'RPKM' (RPKM normalization) are supported
regionTypes	character vector specifying a name for the region type in which count data should be normalized(default: all region types)
...	other arguments depending on the method used. For 'batchCorrect' it should be arguments passed on to <code>limma::removeBatchEffect</code> (most importantly, the batch argument).

**Value**

a new [DsATAC](#) object with normalized count data

**Author(s)**

Fabian Mueller

---

unsupervisedAnalysisSc,DsATACsc-method  
*unsupervisedAnalysisSc-methods*

---

**Description**

Perform unsupervised analysis on single-cell data. Performs dimensionality reduction and clustering.

**Usage**

```
## S4 method for signature 'DsATACsc'
unsupervisedAnalysisSc(
  .object,
  regionType,
  regionIdx = NULL,
  dimRedMethod = "tf-idf_irlba",
  usePcs = 1:50,
  clusteringMethod = "seurat_louvain"
)
```

**Arguments**

<code>.object</code>	<a href="#">DsATACsc</a> object
<code>regionType</code>	character string specifying the region type
<code>regionIdx</code>	indices of regions to be used (logical or integer vector). If NULL (default) all regions of the specified regionType will be used.
<code>dimRedMethod</code>	character string specifying the dimensionality reduction method. Currently on "tf-idf_irlba" is supported
<code>usePcs</code>	integer vector specifying the principal components to use for UMAP and clustering
<code>clusteringMethod</code>	character string specifying the clustering method. Currently on "seurat_louvain" is supported

**Value**

an S3 object containing dimensionality reduction results and clustering

**Author(s)**

Fabian Mueller
